

World War Armies

Product & LiveOps Opportunities

Independent product case study
Fahim Abdulla

Outside-in hypotheses based on hands-on gameplay, supplied screenshots and public product information.

Approach & Guardrails

- Treat observations as hypotheses, not conclusions.
- Validate against internal telemetry, cohorts and qualitative feedback before implementation.
- Use: Observation → Player Problem → Hypothesis → Solution → Production Scope → KPI → Guardrail → Learn.
- Optimize for sustainable player value, not a single KPI in isolation.

01 — Caption-led Store Screenshots

OBSERVATION

Store artwork is cinematic, but selected screenshots could communicate the gameplay promise more immediately.

OPPORTUNITY

Add concise benefit-led captions such as “COMMAND YOUR ARMY” and “LEAD THE ASSAULT” while retaining cinematic imagery.

TEST

A: current screenshots | B: caption-led screenshots

Primary KPI: store-page conversion / install conversion

Guardrails: install quality, D1 retention, acquisition performance

Production scope: Low — creative/ASO experiment.

01 — Caption-led Store Screenshots

02 — Make Matchmaking Wait Time Valuable

 **SEARCH**

EVERY BATTLE
BUILDS A STRONGER YOU

FINDING OPPONENT...

25

Estimated wait time (sec): 25

RIFLE
RIFLEMAN SQUAD
COMMON INFANTRY

 Damage
41.0 **+4.0**

 Health
448.1 **+44.3**

Versatile infantry effective at capturing positions and holding the line.

 **BATTLE TIP**
Deploy multiple Rifleman Squads together to increase their effectiveness. 

 Captures and holds key positions

 Effective against infantry

 Best used in numbers

CANCEL

You can cancel and search again at any time.

*Strategy
Decides
Victory*

02 — Make Matchmaking Wait Time Valuable

OBSERVATION

During testing, matchmaking sometimes took ~35+ seconds. The current search screen offers limited value while waiting.

OPPORTUNITY

Reuse existing troop models, stats and tactical tips in a rotating “Know Your Army” experience while matchmaking status remains visible.

HYPOTHESIS

Useful content may reduce perceived wait frustration and improve unit understanding.

Primary KPI: matchmaking abandonment/cancellation

Secondary: match-start completion, battles/session

Guardrail: actual matchmaking duration

Production scope: Low–Medium; reuse existing assets/data.

03 — Turn Defeat Into Re-engagement

03 — Turn Defeat Into Re-engagement

Add three lightweight post-battle actions:

REMATCH — request another battle against the same opponent.

STRIKE LIST — add the opponent directly to the existing rivalry/Strike system.

QUICK MESSAGE — predefined moderated messages such as “I’ll be back!”, “You got lucky!”, “Good game!” and “Rematch?”

HYPOTHESIS

Convert the emotional moment of defeat into replay, rivalry and social interaction.

KPIs: rematch request/acceptance, completed rematches, battles/session, Strike engagement, session length

Guardrails: reports/negative social behavior, ranking/economy integrity

Production scope: Medium; leverage existing PvP/profile/Strike systems.

04 — Post-Battle Insights

OPPORTUNITY

Give players a lightweight explanation of battle performance before they return to the lobby.

Examples: units deployed/lost, damage dealt/received, objectives captured, strongest-performing unit, contextual improvement prompt.

PLAYER LOOP

Battle → Result → Learn → Improve → Battle Again

HYPOTHESIS

Actionable feedback may turn defeat into progression motivation.

KPIs: battles/session, rematch rate, troop upgrade actions, session depth

Guardrails: result-screen exit rate, information overload

Production scope: Medium; depends on available battle telemetry.

05 — Seasonal / Festival Sales Takeover

OBSERVATION

The lobby already gives limited-time offers strong visibility, but major calendar moments can feel more distinctive than standard offer cards.

OPPORTUNITY

Use a temporary seasonal lobby banner/takeover for high-value moments such as Halloween, Christmas, New Year or Black Friday.

FLOW

Seasonal treatment → banner → themed store/bundles → countdown → event → final-hours reminder

Primary KPIs: banner CTR, store visits, offer conversion, payer conversion, revenue per exposed user, ARPDAU

Guardrails: retention, economy impact, offer fatigue

Production scope: Low–Medium; primarily LiveOps/creative/configuration.

05 — Seasonal / Festival Sales Takeover

06 — Contextual Re-engagement Notifications

OBSERVATION

During my gameplay period, I experienced relatively limited push-notification engagement.

OPPORTUNITY

Prioritize relevant event-driven pushes rather than simply increasing volume: upgrade complete, rewards ready, event start/end, Battle Pass progress, Strike activity, rematch request, inactivity and seasonal LiveOps.

SEGMENT BY

Progression, recent activity, game mode, event participation, payer status, geography/time zone and churn risk.

KPIs: notification open rate, notification-driven return rate, DAU, returning users, event participation

Guardrails: opt-out/uninstall rate, frequency per player.

07 — Comeback Journey for Returning Players

OPPORTUNITY

Players returning after 7/14/30 days may benefit from a structured catch-up experience rather than being dropped directly into the lobby.

Example: “Welcome back, Commander” → completed upgrades → rewards ready → new event/content → next recommended objective → optional comeback missions/pass.

HYPOTHESIS

Reducing returnee friction may improve reactivation and subsequent retention.

KPIs: reactivation rate, returnee D1/D7, sessions/player, comeback objective completion

Guardrails: reward inflation, cannibalization of regular-player rewards

Production scope: Medium.

08 — Competitor Benchmark: A Business Question

SUPPLIED AUG 2026 THIRD-PARTY ESTIMATES

World War Armies: ~110K downloads | ~\$65K unified estimated revenue | stronger supplied rating/sentiment signals

World War: Machines Conquest: ~75K downloads | ~\$280K estimated revenue

INTERPRETATION

Downloads are not active users, so this is NOT ARPU/ARPDau/LTV. The estimates raise a question rather than prove a monetization problem.

QUESTION

Can strong acquisition/player appeal translate into greater sustainable player value?

INVESTIGATE

Payer conversion, ARPDau, ARPPU, LTV, first-purchase behavior, LiveOps participation, offer performance, progression and geographic segmentation.

09 — Platform Mix: Google Play vs iOS

09 — Platform Mix: Google Play vs iOS

SUPPLIED AUG 2026 THIRD-PARTY ESTIMATES

Google Play: ~110K downloads | ~\$50K estimated revenue

Apple App Store: <5K downloads | ~\$20K estimated revenue

OBSERVATION

The supplied estimates suggest materially different acquisition and monetization profiles by platform. They do not establish platform ARPU or LTV.

HYPOTHESIS

If internal cohorts show stronger iOS unit economics, iOS may be an under-scaled acquisition opportunity.

VALIDATE WITH

D1/D7/D30, payer conversion, ARPDAU, ARPPU, LTV, CPI/CAC and ROAS — segmented by platform and geography.

10 — Product & KPI Framework

ACQUIRE → ACTIVATE → ENGAGE → RETAIN → CONVERT → MONETISE → REACTIVATE

Activation: FTUE completion, first battle completion, early progression funnel

Engagement: DAU/MAU, sessions/player, battles/session, event participation

Retention: D1/D7/D30, churn points, cohort retention

Conversion: first-purchase conversion, payer conversion, offer CTR/conversion

Monetisation: ARPDau, ARPPU, revenue, IAP/ad mix, LTV

Economy: sources/sinks, balances, progression speed, bottlenecks

Re-engagement: returning users, event return rate, notification-driven sessions

Principle: pair every primary KPI with guardrails.

11 — Prioritisation & Production Lens

Prioritise opportunities using:

PLAYER IMPACT × BUSINESS VALUE × TIME SENSITIVITY × DEVELOPMENT EFFORT ×
DEPENDENCIES × RISK

Suggested sequencing for validation:

1. Store creative test — low effort / acquisition learning
2. Seasonal banner test — low–medium / monetization learning
3. Matchmaking content — low–medium / engagement learning
4. Defeat re-engagement — medium / PvP + social learning
5. Contextual notifications — medium / reactivation learning
6. Post-battle insights / comeback journey — medium / deeper retention learning

Actual priority should change with internal data and team capacity.

12 — How I Would Validate These Ideas

These recommendations are based on external observation, hands-on gameplay and supplied third-party estimates — not access to Hypemasters' internal telemetry.

For each idea:

1. Define the player problem and hypothesis.
2. Establish baseline and target cohort.
3. Define primary KPI + guardrails before launch.
4. Estimate production effort, dependencies and risks.
5. Run controlled A/B test or staged rollout where appropriate.
6. Evaluate statistical AND practical significance.
7. Iterate, scale or stop based on evidence.

Goal: improve player experience and sustainable business value without over-optimizing a single metric.
